

Get ready for business in North America

Solid Fuel-Fired Hearth Products and Accessories

Meeting North American energy efficiency requirements can be a daunting task for fuel-burning appliance manufacturers. UL can help. In addition to being an EPA-approved third-party certifier for the New Source Performance Standards (NSPS), we provide a variety of safety, performance and reliability testing services.

With unmatched combustion certification experience, we have the knowledge and resources to meet all of your solid-fuel appliance and equipment certification needs. By testing to applicable standards such as UL Standards and Outlines and ULC/CSA series, we can help ensure your products comply quickly and cost-effectively, including factory-built, solid-fuel fireplaces and fireplace stoves, pellet stoves, fireplace inserts, solid-fuel boilers and water heaters, and wood-fired pizza and baking ovens. Accessories for use with these products can also be tested, including wall and floor protectors and venting and chimney components and materials.

We can also help you understand the criteria for evaluation in other markets, such as for the CE Mark according to the Gas Appliance Regulation, or for other product types and combination fuel types.

Tap into our knowledge

We provide educational seminars and can work with you to design a program specifically for you to increase your staff's knowledge about the certification requirements for your products.

Why UL

We can help build confidence in your product's:

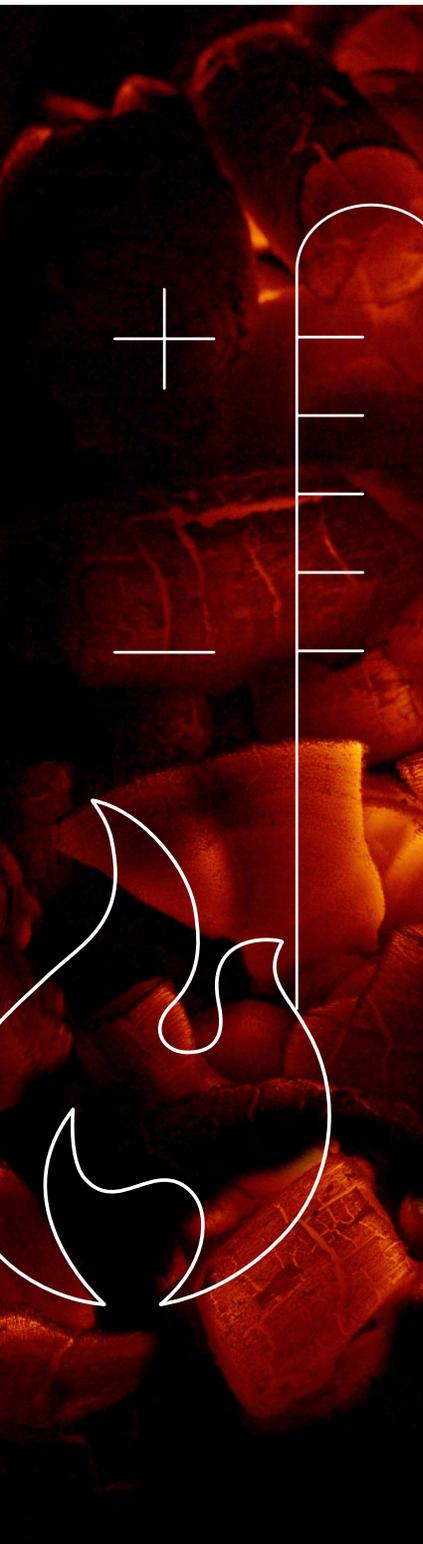

- Design
- Safety and compliance
- Readiness for the market

We can also help you build trust in the market by dealers, installers, code authorities and consumers.

Location

We have state-of-the-art laboratories throughout North America and Europe where testing of these appliances can be conducted. Or, testing can be conducted at the equipment manufacturer's facility and witnessed onsite by a UL representative. We can bring the necessary test equipment to the site, or the manufacturer's calibrated equipment may be used. Manufacturers who elect to conduct testing at their facility must comply with UL Data Acceptance Program (DAP).
